Campus Food Kiosk Menu App

Farah Amr - Kareem Magdy - Razan Ghanem

Customer Discovery

Customer Profile

The primary customers are students at the European Universities in Egypt (EUE), including:

- **University of East London (UEL).**
- **University of Central Lancashire (UCLan).**
- **University of London.**

Secondary users include university staff, lecturers, and anyone who regularly spends time on campus.

Customer Discovery

Problem Statement

Students have limited time between lectures and often struggle to decide where to eat.

Most campus kiosks do not provide accessible menus, forcing students to visit each kiosk or ask staff about meals and prices.

This wastes time and makes comparing food options difficult.

Customer Discovery

Research and Observation

We spoke with staff members at three campus food kiosks:

1. Batatas & Zalabia
2. Eat It Nao
3. Krispy Kreme

One cashier had to list the entire menu from memory.

A student asked to see the menu we had collected to help decide what to order.

Staff supported the idea of digital menus and helped us collect information.

App Ideas and Selection

Three Ideas Considered

I. **Campus Food Kiosk Menu App (UniBites): A mobile app displaying campus kiosk menus, prices, working hours, and contact information.**

II. **University All-in-One Hub: An app combining Moodle, Outlook, university announcements, and course materials.**

III. **Historical Places in Egypt: An app providing information about historical sites, including ticket prices, opening hours, and locations.**

App Ideas and Selection

Chosen Idea and Why

We selected the Campus Food Kiosk Menu App as our final project because:

- ➔ **Solves a real problem: We experienced the difficulty of finding campus food options ourselves and observed other students facing the same issue.**
- ➔ **Realistic to develop: Suitable for our current foundation-year skills while allowing us to improve our Flutter programming and design abilities.**
- ➔ **Staff support: Kiosk employees welcomed the idea and helped us collect menu information.**
- ➔ **Immediate usefulness: Even a basic version with menus and prices could help students make quicker decisions.**

App Ideas and Selection

Why We Rejected the Other Ideas

- **University All-in-One Hub: Requires connecting multiple university platforms and may involve accessing private information, making development more complicated.**

- **Historical Places in Egypt: Has a much broader target audience and does not solve an everyday problem within our university community.**

Proposed Solution and MVP

Proposed Solution

UniBites is a mobile application that brings campus food kiosks' menus and information together in one accessible place, helping students explore options and make quicker decisions.

Proposed Solution and MVP

MVP - MUST HAVE FEATURES

I. **Search Bar: Search for meals, food items, and kiosks.**

II. **Food Kiosk Directory: Displays Batatas & Zalabia, Eat It Nao, and Krispy Kreme.**

III. **Digital Menus: Shows complete menus, food items, sizes, and prices.**

IV. **Working Hours: Displays each kiosk's opening days and hours.**

V. **Simple User Interface: Easy-to-use design without requiring registration or login.**

Proposed Solution and MVP

Future Features - Nice to Have

I. **Coming Soon Section: Introduces other campus restaurants that may join the app.**

II. **Food Images: Pictures of available meals.**

III. **Price Comparison: Compares similar items across different kiosks.**

IV. **Pre-ordering: Allows users to order through the app before arriving at the kiosk.**

Search Screen

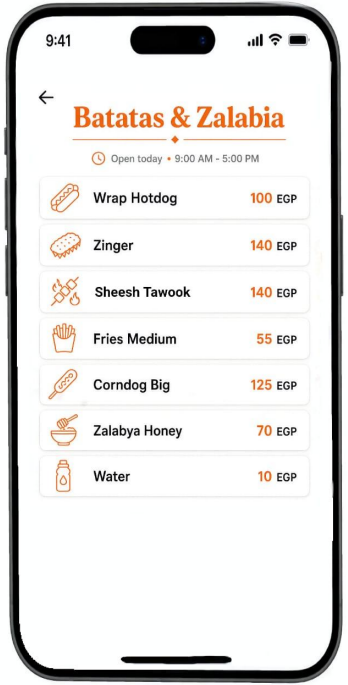

Suggests a unique meal from every menu
When searching anything it gives related keywords

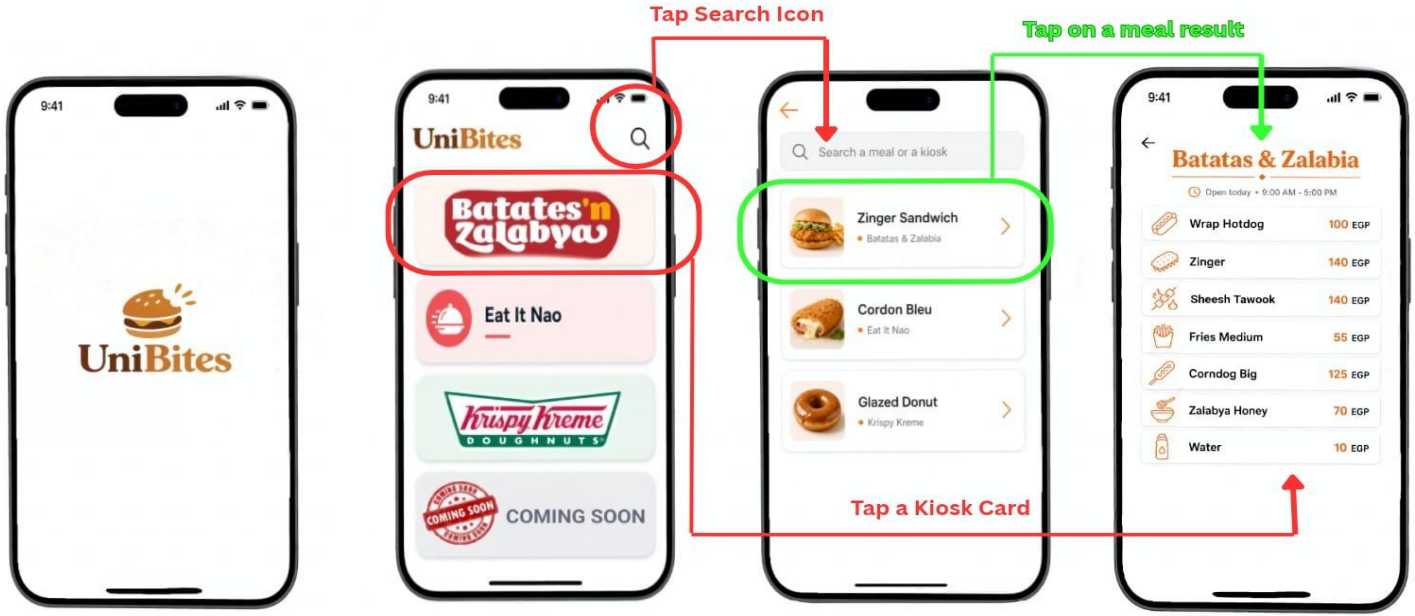

Screen Designs

Menu Screen (Results Screen)

Appears when searching for a menu or when clicking on any food kiosk card in the home screen

Navigation Flow

Next Steps

Based on the proposed solution and MVP, the next steps are:

I. **Finalize the menus, food items, sizes, and prices for the three selected kiosks.**

II. **Collect and confirm each kiosk's working hours and contact information.**

III. **Design the app screens and user interface.**

IV. **Develop the MVP using Flutter.**

V. **Add the search bar, kiosk directory, digital menus, and working hours.**

VI. **Test the application to ensure all information and features work correctly.**

VII. **Consider introducing future features depending on available time and development progress**

Thank You for Listening
